

Appendix F The position where the *Solyc07g055560* gene is fused is covered by published RNA-seq reads. Each bar represents the sequencing reads aligned here. When more than 20% of the sequencing reads are different from the reference genome, they are marked with different colors: red-T, blue-C, green-A, orange-G. Otherwise, it is marked in gray. The position of this gene fusion may be between 63,469,840 bp – 63,469,850 bp on chromosome 7, as shown by the red dotted box in the figure.
